

FutureMe AI

From “**I think**” to “**I tried.**”

ช่วยให้นักเรียนเข้าใจตัวเอง ก่อนตัดสินใจอนาคต

A decision-support prototype for Thai secondary and vocational students.

RESEARCH-INFORMED · NOT VALIDATED
GUIDANCE

Explore the next step—not one final answer.

Research synthesis · Product strategy · UX · AI architecture · Validation

Several hypotheses.

One reversible next step.

Students decide before they have evidence

Thai education has visible forks; the day-to-day reality behind each route is harder to test.

Decisions arrive before experience.

FutureMe's design hypothesis

Students need a safe way to test a direction before committing time, prerequisites and money.

CONSEQUENTIAL CHOICE POINTS

PRIMARY USER RESEARCH: NOT YET RUN

Criteria vary by school, campus, programme and admission year.

The cost is mismatch—and a moving target

The evidence supports earlier exploration, not a promise of one perfect match.

56%

**work outside their field
of study**

T D R I C O N T E X T

27%

**work below their skill
or qualification level**

S A M E P O P U L A T I O N

39%

**of core skills expected
to change by 2030**

W E F E M P L O Y E R S U R V E Y

**Design implication: help students test, compare and revise—before a
direction becomes expensive to change.**

Caution: the TDRI public page describes a broadly highly educated group and does not expose its denominator or method. These figures are problem context, not a FutureMe performance baseline.

Information exists. Interpretation is fragmented.

The gap is not another list—it is a visible chain from self-knowledge to action.

What is
missing

Admission criteria expire. Career-to-programme links are many-to-many. A trustworthy product must show scope, date and source.

The idea evolved from matching to learning

Each research input changed a product decision.

FutureMe is an **evidence loop**, not a career oracle.

Conversation frameworks guide prompts; they do not validate the questionnaire.

Research shaped the model—and what we rejected

Only constructs that change the product's output earn a place in the assessment.

**INCLUDED****RIASEC interest vector**

A starting hypothesis for exploration

**DESIGN
INPUT****Socratic prompts + STAR**

Conversation scaffolds—not psychometrics

DEFERRED**Work values**

Route catalogue lacks value profiles

REJECTED**MBTI-type matching + learning styles**

Unstable types / weak evidence

The current 30-item instrument is research-informed—but has never been validated.

Five product rules follow directly from the evidence

Research is useful only when it changes what the product does.

- | | | |
|----|---|--|
| 01 | Interests still move in adolescence | → Offer hypotheses—not a verdict; keep routes reversible |
| 02 | Self-report is only one signal | → Add a scenario mission that can agree or disagree |
| 03 | AI recommendations can become opaque | → Rules decide; show evidence, unknowns and contradictions |
| 04 | Admissions and labour data expire | → Carry source, scope, last-checked date and freshness |
| 05 | The users are minors | → Guest-first, browser-local; consent before saving or sharing |

Private by default · Evidence before confidence · One useful next action

FutureMe turns reflection into a low-stakes experiment

The experience accumulates evidence instead of manufacturing certainty.

EVIDENCE — NOT CERTAINTY

A learner can revise answers, override the mission, compare routes or stop.

Each step gives the learner control

The output at every stage is provisional, inspectable and editable.

AI supports the conversation—not the decision

Current capabilities and future architecture are deliberately separated.

TODAY · IMPLEMENTED

Optional LLM: reword reasons only
Off by default · no learner answers

FUTURE · PLANNED

Rules decide. Retrieval grounds. AI explains.

Recommendation logic is explicit and auditable

Same answers, same routes. The model cannot change the decision.

DESIGN - JUDGEMENT WEIGHTS · NOT FITTED TO OUTCOMES

Interest fit compares the shape of all six dimensions; mission evidence remains independent so disagreement is visible.

A complete prototype already runs end to end

These are screenshots from the implemented app—not concept mockups.

One item at a time

Several hypotheses

30-day experiment

- TH / EN + THEMES
- 3 MISSIONS
- 6 ILLUSTRATIVE ROUTES
- BROWSER-LOCAL
- 234 TESTS
- 20 E2E

Route constraints and mission rubrics remain illustrative and unvalidated.

The difference is what happens after the score

FutureMe changes a result into a testable next step.

TRADITIONAL CAREER TEST

FUTUREME EVIDENCE LOOP

Validation is the next product—not a footnote

The analysis pipeline is verified. The instrument is not.

PIPELINE VERIFIED ≠
INSTRUMENT VALIDATED

PROPOSED SUCCESS MEASURES

ASSESSMENT Reliability · item quality · construct structure

ROUTES Relevance · counsellor agreement · diversity

EXPERIENCE Completion · comprehension · route exploration

LONG-TERM Can the student still explain and defend the choice?

No reliability, norms or validity results exist yet.

From runnable demo to trusted decision support

Every phase has a gate; partnerships stay exploratory until something is signed.

Phase 3: adapt Thai translation · validate instrument + missions · licensed route data · bias + safety audit

Career test → **AI career discovery companion**

ช่วยให้เด็กเข้าใจตัวเอง ทดลองทางเลือก และตัดสินใจด้วยเหตุผลที่อธิบายได้
